Abstracts

Alumina catalyst carriers are porous, high-surface-area materials primarily composed of aluminum oxide (Al_2O_3) that serve as a structural and functional support for catalytically active substances, such as metals or metal oxides, in heterogeneous catalytic processes. These carriers are engineered to provide optimal physical properties including specific surface area, pore volume, pore size distribution, mechanical strength, and thermal stability to enhance the efficiency, selectivity, and longevity of catalysts across applications such as petroleum refining, chemical synthesis, and environmental catalysis (e.g., automotive exhaust treatment). Their performance is critical in determining reaction kinetics, mass transfer, and catalyst durability, making them a foundational component in industrial catalysis where tailored material characteristics directly influence process economics and output quality.

The global Alumina Catalyst Carriers market size was estimated at USD 680.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
