Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Alumina and Polymer-based Thermal Interface Materials competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Alumina (Al_2O_3) is an inorganic ceramic material. It is widely used as a thermal conductive filler in thermal interface materials (TIMs) due to its high thermal conductivity, electrical insulation, chemical stability and low cost. In thermal interface materials, the main function of alumina is to build a thermal conductive path, reduce the interface thermal resistance, and thus improve the heat dissipation efficiency. Polymer-based thermal interface materials are a type of composite material prepared by filling high thermal conductive fillers (such as alumina, boron nitride, graphene, etc.) with organic polymers as the matrix. It is used to fill the microscopic gaps between electronic components and heat sinks, reduce contact thermal resistance, and improve heat dissipation efficiency.

The global Alumina and Polymer-based Thermal Interface Materials market size was estimated at USD 3116.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
