Report Overview

Alumina Trihydrate (ATH) is a white, crystalline powder chemically represented as $\text{Al}(\text{OH})_3$, widely used as a flame retardant and smoke suppressant in polymers, plastics, rubber, and coatings due to its ability to release water molecules when heated, thereby cooling the material and diluting flammable gases. It also finds applications in pharmaceuticals, cosmetics, and as a raw material for aluminum production. The market for ATH is driven by stringent fire safety regulations across industries, particularly in construction, automotive, and electronics, where flame-retardant materials are essential. The increasing demand for non-halogenated flame retardants, as opposed to traditional brominated or chlorinated alternatives, further boosts ATH adoption due to its environmentally friendly profile. However, competition from alternative flame retardants like magnesium hydroxide and the volatility in raw material prices (primarily bauxite) pose challenges. Regionally, Asia-Pacific dominates the market due to rapid industrialization and construction activities, while North America and Europe follow, driven by strict regulatory standards and sustainability initiatives. The market is expected to grow steadily, supported by innovations in surface-treated ATH for enhanced compatibility with polymers and expanding applications in emerging sectors like electric vehicle batteries.

The global Alumina Trihydrate (ATH) market size was estimated at USD 71.18 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.31% during the forecast period.
