Abstracts

Aluminised steel sheet is a composite material consisting of a carbon steel substrate coated with an aluminum-silicon alloy, typically applied through a hot-dip process, which imparts enhanced corrosion resistance, particularly against high-temperature oxidation and atmospheric conditions, while retaining the mechanical strength and formability of the base steel; this material is primarily utilized in applications such as automotive exhaust systems, heat exchangers, industrial ovens, agricultural equipment, and household appliances like water heaters and baking ovens, where durability under thermal cycling and exposure to corrosive environments is critical. The global market for aluminised steel sheet is characterized by steady demand driven by industrialization, automotive production, and infrastructure development, with key regional markets including North America, Europe, and Asia-Pacific, where manufacturing and construction activities are prominent; growth is further supported by the material's cost-effectiveness compared to stainless steel in certain applications and its recyclability, aligning with sustainability trends. However, the market faces challenges such as volatility in raw material prices (aluminum and steel), competition from alternative materials like galvanized steel or advanced coatings, and environmental regulations impacting production processes; innovation in coating technologies and expansion into emerging economies present significant opportunities, while established players focus on product differentiation through improved alloy compositions and application-specific performance enhancements to maintain competitiveness.

The global Aluminised Steel Sheet market size was estimated at USD 8650.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
