Abstracts

Aluminium alloy propellers are marine propulsion components manufactured from aluminium-based alloys, typically incorporating elements such as magnesium, silicon, or zinc to enhance strength, corrosion resistance, and fatigue performance while maintaining relatively low weight compared to alternatives like stainless steel or bronze. These propellers are engineered with specific blade geometries, pitches, and diameters to optimize thrust efficiency, fuel economy, and maneuverability for various vessel types, including recreational boats, small commercial craft, and certain industrial applications. The alloy composition allows for a balance between durability in saltwater or freshwater environments and cost-effectiveness, making them a popular choice in segments where performance must be balanced against budget constraints without sacrificing reliability.

The global Aluminium Alloy Propeller market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
