## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Aluminium Binder Pitch competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Global sales of Aluminium Binder Pitch was about 4680 k tons in 2024 with average price of 930 USD/ton. Key raw materials of the product is coal tar or petroleum pitch. The average gross margin of the industry ranges from 10%-15%. Aluminium Binder Pitch is a coal-tar or petroleum-derived pitch used as a carbonaceous binder in carbon materials for the aluminium industry, especially in prebaked anodes, cathode blocks and ramming pastes used in primary aluminium electrolysis cells. Finely ground calcined coke or other carbon fillers are mixed with aluminium binder pitch, then formed and baked. During mixing and forming, the pitch softens and wets the coke particles, providing plasticity and green strength; during baking it carbonizes to form a continuous carbon matrix that bonds the filler together and gives the anode or cathode its mechanical strength, electrical conductivity and resistance to chemical attack by molten aluminium and cryolite. Compared with general-purpose pitch, aluminium binder pitch is tightly specified in terms of softening point, coking value, volatile content, quinoline-insoluble (QI) content, sulphur and metal impurities, in order to meet the stringent performance and environmental requirements of modern aluminium smelters.

The global Aluminium Binder Pitch market size was estimated at USD 4352.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
