Abstracts

Aluminium Clad Steel stranded is a composite Concentric-lay-stranded conductors made of aluminum-clad steel wires. ACS cable is well known for its combination of corrosion resistance, high strength and superior electrical conductivity. These properties make it an excellent choice either as overhead static wire (ground wire) It can also be used as core in ACSR conductors. The Aluminium Clad Steel (ACS) market is driven by several factors that contribute to its growth and demand. Here are some key drivers for the ACS market:

Corrosion resistance: One of the major drivers for the ACS market is its excellent corrosion resistance. The aluminum cladding on the steel core provides a protective barrier against corrosion, making ACS conductors suitable for various applications, especially in coastal and highly corrosive environments. This corrosion resistance feature increases the lifespan of ACS conductors and reduces maintenance costs.

Lightweight and high strength: ACS conductors offer a unique combination of lightweight and high strength. The steel core provides the necessary strength and mechanical support, while the aluminum cladding reduces the weight significantly compared to all-steel conductors. This lightweight property of ACS conductors simplifies installation and reduces the load on supporting structures, making them an attractive choice for overhead transmission and distribution lines.

Cost-effectiveness: ACS conductors offer cost advantages over traditional conductors like ACSR (Aluminium Conductor Steel Reinforced) and all-aluminum conductors. The steel core of ACS conductors is more economical than using pure aluminum or copper as the conductor material. Additionally, the reduced weight of ACS conductors can lead to lower transportation costs and ease of handling during installation, further enhancing their cost-effectiveness.

High ampacity and conductivity: The steel core in ACS conductors provides excellent electrical conductivity, while the aluminum cladding further enhances the ampacity of the conductor. This high ampacity enables ACS conductors to carry more current, making them suitable for applications where high power transmission is

required, such as long-distance transmission lines and high-demand industrial installations. Compatibility with existing infrastructure: ACS conductors are designed to be compatible with existing infrastructure, making them suitable for retrofitting or upgrading projects. They can be easily integrated into the existing power transmission and distribution systems without requiring significant modifications. This compatibility factor simplifies the adoption of ACS conductors in infrastructure projects and contributes to their market demand. Renewal and expansion of power grids: As power grids age and require renewal or expansion, there is a growing need for conductors that can meet the increasing demand for electricity. ACS conductors provide a reliable and efficient solution for power grid expansion and upgrading projects. The superior mechanical strength and electrical performance of ACS conductors make them a preferred choice in such infrastructure development initiatives. Growing renewable energy sector: The rapid growth of the renewable energy sector, including wind and solar power, drives the demand for ACS conductors. These conductors are used in the construction of transmission lines that connect renewable energy generation sites to the grid. ACS conductors' lightweight, corrosion resistance, and high ampacity characteristics make them well-suited for renewable energy projects.

The global Aluminium Clad Steel (ACS) market size was estimated at USD 2294.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
