Abstracts

Aluminizing galvanized steel refers to a specialized type of steel product that combines the protective benefits of both aluminum and zinc coatings through a hot-dip process. This material is distinct from traditional galvanized steel, which only uses a zinc coating, or aluminized steel, which solely applies an aluminum-silicon alloy layer. The aluminizing galvanized variant typically involves depositing a dual-layer coating: an inner layer rich in zinc to provide robust sacrificial corrosion protection, particularly at cut edges and scratches, and an outer layer rich in aluminum to offer superior resistance to high-temperature oxidation and atmospheric corrosion. This hybrid approach results in a product that effectively bridges the performance gap between galvanized and aluminized steels, offering enhanced durability in demanding environments such as those involving heat exposure, moisture, and chemical agents.

The global Aluminizing Galvanized Steel market size was estimated at USD 10250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
