Abstracts

Aluminum is one of the most common metals in the world. It can be found in kitchen utensils, cars, street lights, and aluminum foil food packaging. Aluminum is a silvery-white, metallic material. It is light, malleable, ductile, and non-magnetic under normal conditions. It has a density of 2.7 g/cc, a melting point of 660°C, and vapor pressure of 10⁻⁴ Torr at 1,010°C. Although it is not a strong material, it is a good conductor of heat and electricity and can form an oxide layer resistant to corrosion. Due to its high reactivity, it is rarely found in nature as a free element. When evaporated in a vacuum, aluminum layers form a reflective coating found on telescopes, automotive headlamps, mirrors, packages, and toys. It is widely used in the aerospace, automotive lighting, OLED, and optical industry.

The global Aluminum Al Evaporation Materials market size was estimated at USD 432.18 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
