Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Aluminum Alloy Sacrificial Anode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Aluminum alloy sacrificial anodes are mainly used for sedimentation of water in water storage tanks. Due to the high concentration of chloride ions in the deposited water and the high temperature, corrosion is more severe. The aluminum alloy anode of the storage tank is made of high-quality raw materials and produced according to national standards. Pure aluminum cannot be directly used as a sacrificial anode material because its surface passivation film has a relatively positive potential. By adding alloys, the formation of oxide films can be prevented and the activity of aluminum anodes can be maintained. Aluminum anode alloys mainly contain zinc, cadmium, indium, mercury, tin, etc. Zinc serves as the initial activator for aluminum anodes, while other alloys maintain the long-term activity of aluminum anodes.

The global Aluminum Alloy Sacrificial Anode market size was estimated at USD 1263.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
