Abstracts

Aluminum coated fibers, also known as aluminized fibers, are specialty textile materials where a fine layer of pure aluminum or aluminum alloy is applied to the surface of base fibers?such as glass, aramid, silica, or ceramic?through processes like physical vapor deposition (PVD) or thermal spraying, resulting in a composite material that combines the flexibility and tensile strength of the underlying fiber with the reflective, conductive, and thermal properties of the metallic coating. These fibers are engineered to provide high reflectivity to radiant heat, electromagnetic interference (EMI) shielding, electrical conductivity, and resistance to oxidation and corrosion, making them essential in applications requiring thermal insulation, static dissipation, or signal reflection, including protective clothing for firefighters and industrial workers, aerospace and defense components, high-temperature gaskets and seals, and specialized composites for electronics or energy sectors.

The global Aluminum Coated Fibers market size was estimated at USD 58.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
