Abstracts

Aluminum extrusion billets are semi-finished cylindrical or rectangular cast products, typically manufactured from primary aluminum or recycled aluminum scrap, which serve as the raw material input for the extrusion process. These billets are homogenized and preheated to specific temperatures to achieve optimal plasticity, enabling them to be forced through a die to create complex cross-sectional profiles with consistent mechanical properties and surface quality. Key characteristics include alloy composition (such as 6xxx or 7xxx series), dimensions, microstructure uniformity, and freedom from defects like porosity or inclusions, all of which directly influence the extrudability, strength, and finish of the final aluminum profiles used across industries such as construction, automotive, aerospace, and consumer goods.

The global Aluminum Extrusion Billets market size was estimated at USD 19500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
