Report Overview

Aluminum hydroxide flame retardant is a commonly used flame retardant additive, which can provide flame retardant properties in materials and reduce the risk of fire. Aluminum hydroxide ($\text{Al}(\text{OH})_3$) is the most commonly used aluminum hydroxide flame retardant. Aluminum hydroxide flame retardants decompose at high temperatures to produce water vapor and aluminum oxides, which absorb heat and dilute the flame, thereby inhibiting the combustion process. At the same time, aluminum hydroxide can also form a protective layer to isolate the contact between the material and the fire source and slow down the spread of the fire. Aluminum hydroxide flame retardants are widely used in various plastics, rubbers and other combustible materials, including polymers, wires and cables, construction materials, electronic products, auto parts, etc. Adding aluminum hydroxide flame retardant can improve the flame retardancy of the material and make it meet the fire safety requirements

The global Aluminum Hydroxide Flame Retardant market size was estimated at USD 1054 million in 2023 and is projected to reach USD 1566.34 million by 2032, exhibiting a CAGR of 4.50% during the forecast period.
