Abstracts

Aluminum hypophosphite is an inorganic compound primarily utilized as a highly effective flame retardant additive in various polymer systems, including engineering plastics, coatings, adhesives, and synthetic textiles. It functions by promoting char formation and releasing phosphorous-containing radicals that interrupt the combustion cycle, offering advantages such as low toxicity, halogen-free properties, and compatibility with other additives. Its chemical stability and efficiency at relatively low loadings make it a preferred choice in industries requiring stringent fire safety standards, such as electronics, construction, and automotive manufacturing, where it enhances material safety without significantly compromising mechanical or aesthetic properties.

The global Aluminum Hypophosphite market size was estimated at USD 48.26 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
