Abstracts

Spherical aluminum powder is commonly used in the production of conductive paste. It exhibits excellent electrical conductivity and is widely utilized in various industries, including electronics, automotive, and aerospace. Conductive paste is a mixture of conductive materials and a binder that is used to create electrical connections in electronic components. The spherical shape of aluminum powder provides several advantages in this application: Enhanced conductivity: Spherical aluminum powder has a larger surface area compared to other shapes, facilitating better electrical contact and thus improving conductivity. Improved flowability: The spherical particles offer good flow characteristics, allowing for easier dispersion within the binder and resulting in a more uniform and consistent conductive paste. Reduced aggregation: Due to their smooth surface and shape, spherical aluminum particles tend to have less tendency to agglomerate or form clusters, promoting even distribution throughout the paste.

The global Aluminum Powder For Conductive Paste market size was estimated at USD 358.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
