Report Overview

The aluminum shell secondary filling machine is a machine and equipment used for secondary filling of aluminum containers. Different from the aluminum shell primary liquid injection machine, the aluminum shell secondary liquid injection machine can re-inject liquid into the already filled aluminum shell during the liquid injection process to further enhance product performance or achieve specific functional requirements. The aluminum shell secondary liquid injection machine usually consists of a liquid injection system, a control system and a delivery system. The liquid injection system re-injects liquid into the aluminum shell that has been filled with liquid through a nozzle or injection needle, filling the liquid into the interior of the aluminum shell. The control system is used to control parameters such as flow rate, time and pressure of liquid injection to ensure the accuracy and stability of liquid injection. The conveying system is used to transport the filled aluminum shell into and out of the filling area to realize the automated filling process. The aluminum shell secondary liquid injection machine is mainly used for some special product needs, such as pharmaceutical packaging, cosmetic packaging, etc. Through secondary injection, the performance of the product can be further improved based on the already injected liquid, such as adding antibacterial, moisturizing and other functions. The aluminum shell secondary liquid injection machine has the characteristics of high efficiency, precision and automation, which can improve product quality and competitiveness.
