Abstracts

Aluminum silicate fiber, also known as refractory ceramic fiber (RCF), is a high-performance amorphous synthetic material composed predominantly of alumina (Al₂O₃) and silica (SiO₂), engineered for exceptional thermal insulation properties in extreme temperature environments. It is manufactured through melting and fiberizing raw materials such as calcined kaolin or blends of alumina and silica sands, resulting in a lightweight, low-thermal-conductivity material available in various forms including bulk fibers, blankets, modules, boards, and papers. Its primary function is to provide energy-efficient insulation, thermal shock resistance, and fire protection in industrial applications, with classifications ranging from standard-grade fibers (working temperatures up to ~1260°C) to high-purity or zirconia-enhanced grades capable of withstanding temperatures exceeding 1400°C. While valued for its efficiency, handling and usage are regulated due to potential health risks associated with airborne respirable fibers, leading to increased adoption of biosoluble alternatives in some markets.

The global Aluminum Silicate Fiber market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
