Abstracts

Aluminum is one of the most common metals in the world. Aluminum is a silvery-white, metallic material. It is light, malleable, ductile, and non-magnetic under normal conditions. It has a density of 2.7 g/cc, a melting point of 660°C, and a vapor pressure of 10⁻⁴ Torr at 1,010°C. Although it is not a strong material, it is a good conductor of heat and electricity and is able to form an oxide layer that is resistant to corrosion. Due to its high reactivity, it is rarely found in nature as a free element. Sputtering is the process of forming a thin film when the object is attached to the target substrate by the sputtering and scattering, and the sputtering target is the material for high-speed particle bombardment. High-purity aluminum targets are target material products that meet the technical requirements of high-purity aluminum targets and are prepared using high-purity aluminum ingots as raw materials and using processing methods such as forging, hot rolling, and cold rolling. In this report, we counted aluminum sputtering target for semiconductor. The Asia-Pacific will occupy for more market share in following years, especially in China, Japan, Korea and Taiwan. North America, especially The United States, will still play an important role, which cannot be ignored. Any changes from United States might affect the development trend of aluminum sputtering target for semiconductor. Manufactures of aluminum sputtering target for semiconductor, represented by Linde, Sumitomo Chemical, Konfoong Materials, TOSOH, etc., have been involved in this field earlier. After decades of technical accumulation, they occupy the vast majority of market share. The consumption volume of aluminum sputtering target for semiconductor is related to downstream industries and global economy. As there will always be some uncertain in the global economy in the following years, the growth rate of Aluminum Sputtering Target for Semiconductor industry may not keep that fast. But it is surely forecasted that the market of aluminum sputtering target for semiconductor is still promising. Consumer electronics, vehicle electronics,

communication electronics and other downstream industries have a higher demand on the product quality and stability. When the downstream customers, especially the world's leading companies select suppliers, the supplier qualification barriers are higher, and the certification cycle is longer.

The global Aluminum Target Material for Mainstream 300mm Wafers market size was estimated at USD 147.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
