Abstracts

Aluminum titanate ceramic is a specialized advanced ceramic material characterized by its exceptionally low coefficient of thermal expansion, high thermal shock resistance, and excellent resistance to thermal fatigue, making it particularly suitable for applications involving extreme and rapid temperature fluctuations. It is primarily used in demanding industrial environments, such as in automotive exhaust systems (e.g., catalytic converter substrates and diesel particulate filters), metallurgical processing equipment, and components for high-temperature furnaces, where its ability to withstand thermal cycling without cracking or degrading is critical. The material's microstructure, which includes microcracks that accommodate thermal stress, contributes to its unique properties, though it also results in relatively lower mechanical strength compared to some other structural ceramics, limiting its use in load-bearing applications.

The global Aluminum Titanate Ceramic market size was estimated at USD 85.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
