## Abstracts

Ambulance dispatch software, also known as Computer-Aided Dispatch (CAD) or EMS software, is a system that helps dispatchers and emergency responders efficiently manage incident calls, track vehicle locations, and assign personnel and resources. Key features include Automated Vehicle Location (AVL) for real-time tracking, automated route planning, communication tools between dispatch and field units, and decision support protocols to guide dispatchers in gathering information and providing instructions. Future dispatch software is deeply integrated with multiple cutting-edge technologies. The high speed and low latency of 5G networks ensure the stable operation of applications such as in-vehicle remote consultation systems and high-definition video guidance, making ambulances true "mobile ICUs." AI is beginning to play a role in emergency care; for example, some software has integrated AI to assist in generating medical records, and it has great potential in supporting decision-making and predicting disease progression. Ambulance dispatch software is evolving towards greater intelligence, efficiency, and collaboration. In the future, we can expect to see wider urban and rural coverage, using technology to bridge the "last mile" of grassroots emergency care. Deeper cross-departmental collaboration, with information sharing with public security, transportation, and fire departments, will further improve the efficiency of collaborative rescue. More mature AI applications will provide stronger support in dispatch decision-making and risk warning.

The global Ambulance Dispatch Software market size was estimated at USD 1624.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.60% during the forecast period.
