Abstracts

Amides anesthetics are a class of local anesthetics that are chemically derived from amide compounds. These anesthetics block the transmission of nerve impulses by inhibiting the movement of sodium ions through nerve cell membranes, thereby preventing the sensation of pain. Unlike ester anesthetics, amides are metabolized in the liver (as opposed to plasma esterases), and they tend to have a longer duration of action with fewer allergic reactions. They are widely used in various medical fields, including dental procedures, regional anesthesia, and in minor surgeries.

The global Amides Anesthetic market size was estimated at USD 1998.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
