Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amine Modified Acrylate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Amine modified acrylates are acrylate polymers obtained by introducing amine groups into the molecular chain of acrylates. They typically exhibit low viscosity, low odor, and easy curing. The upstream industry mainly consists of basic chemical raw materials, with core components including bulk chemicals such as propylene and benzene, which form the basis for the production of acrylic acid and ester monomers. Furthermore, the supply and technological level of amine modifiers directly determine the final properties and types of amine-modified acrylate products. Global sales volume in 2024 was approximately 48,000 tons, with an average market price of approximately US\$2,200 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of production equipment, typically ranging from 300 to 1,000 tons per year, with industry gross profit margins ranging from 12% to 28%.

The global Amine Modified Acrylate market size was estimated at USD 106.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
