Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amine Modified Polyether Acrylate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Amine modified polyether acrylate is a polyether acrylate oligomer obtained by acrylate esterification with polyether diol/polyol as the backbone. It is then modified photocurable oligomers that are given surface curing promotion, wetting and odor reduction by reacting with amines or introducing amine groups into the polymer chain (or forming amine-Michael addition). The upstream sector mainly includes basic petrochemical raw materials such as ethylene oxide (EO) and propylene oxide (PO), as well as key intermediates such as polyether polyols, acrylic acid, amine compounds, and polymerization inhibitors. Amine-modified polyether acrylates are mainly used in UV-curable coating systems, serving as reactive diluents, improving coating toughness, and surface treatment agents. Global sales in 2024 were approximately 25,000 tons, with an average market price of approximately US\$2,400 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of the production equipment, typically ranging from 300 to 1,000 tons per year, with industry gross profit margins ranging from 12% to 28%.

The global Amine Modified Polyether Acrylate market size was estimated at USD 57.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
