## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amine Polyurethane Catalyst competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Amine polyurethane catalyst refers to a family of tertiary amines, polyamines, and amine ether compounds designed to control the reaction kinetics of polyurethane formation. These catalysts accelerate both the gelling reaction between isocyanates and polyols and the blowing reaction between isocyanates and water, enabling precise tuning of rise profile, cure balance, and cell morphology. Common categories include tertiary amines, diamines, amine ethers, and quaternary ammonium salts. They are widely used across flexible foams, rigid foams, elastomers, and various CASE applications. In 2024, global production of amine polyurethane catalysts reached 201.5 k tons, with an average selling price of US\$5,156 per ton. A typical single-line production capacity is approximately 5,000 tons, and the industry's gross profit margin is approximately 20%-30%. Cost structure: Direct materials account for approximately 70%, manufacturing costs account for approximately 20%, and labor costs account for approximately 10%. Industry chain: Upstream consists of amine raw materials, ether raw materials, and organic amine intermediates; downstream consists of polyurethane foam and CASE material manufacturers.

The global Amine Polyurethane Catalyst market size was estimated at USD 1039.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
