Report Overview

Aminopolycarboxylic acid (complexone) is a compound containing one or more nitrogen atoms connected through carbon atoms to two or more carboxyl groups. It is a chelating agent which has molecules with the ability to provide more than one bond to a metal ion, thereby augmenting the stability of the ion complex. The chelating properties of aminopolycarboxylates can be engineered by varying the groups linking the nitrogen atoms so as to increase selectivity for a particular metal ion. Chelation represents a particular way of binding ions and molecules with metal ions. It involves the formation of multiple separate coordinate bonds between a polydentate ligand and single central atom. Usually, these ligands are organic compounds and are referred as sequestering agents, chelating agents, chelators or chelants. Aminocarboxylic acid is used in numerous technical and industrial applications.
