Abstracts

Aminopropyl dimethicone is a modified silicone compound derived from dimethicone, where aminopropyl functional groups are introduced into the silicone backbone, enhancing its affinity for proteins and hair, particularly through ionic interactions with negatively charged keratin surfaces. This cationic nature distinguishes it from conventional silicones by imparting substantive conditioning, detangling, and anti-static properties, making it a key ingredient in hair care formulations such as conditioners, masks, and leave-in treatments. Its ability to form durable, smooth films on hair strands improves manageability and shine while reducing friction and flyaways, and it is often used in combination with other silicones or conditioning agents to balance sensory attributes and performance across diverse product types.

The global Aminopropyl Dimethicone market size was estimated at USD 520.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
