Abstracts

Ammonium hexafluorozirconate is an inorganic compound with the chemical formula $(\text{NH}_4)_2\text{ZrF}_6$, widely used as a key precursor in the production of zirconium and zirconium-based chemicals, particularly within the ceramics, glass, and metal surface treatment industries. It serves as a crucial raw material in the manufacturing of opacifiers for ceramic glazes and enamels, where it enhances whiteness and opacity, and is also employed in the creation of refractory materials, abrasives, and certain specialized alloys. Additionally, its role extends to the nuclear industry, where high-purity forms are utilized in zirconium alloy production for cladding nuclear fuel rods due to zirconium's low neutron absorption cross-section. The compound is typically synthesized through the reaction of zirconium salts with ammonium fluoride or hydrofluoric acid under controlled conditions, and its market demand is closely tied to industrial activities in sectors such as construction, automotive, and energy.

The global Ammonium Hexafluorozirconate market size was estimated at USD 35.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
