Report Overview

An amorphous metal transformer (AMT) is a type of energy efficient transformer found on electric grids. The magnetic core of this transformer is made with a ferromagnetic amorphous metal. The typical material (Metglas) is an alloy of iron with boron, silicon, and phosphorus in the form of thin (e.g. 25 μm) foils rapidly cooled from melt. These materials have high magnetic susceptibility, very low coercivity and high electrical resistance. The high resistance and thin foils lead to low losses by eddy currents when subjected to alternating magnetic fields. On the downside amorphous alloys have a lower saturation induction and often a higher magnetostriction compared to conventional crystalline iron-silicon electrical steel.

The global Amorphous Alloys Transformer market size was estimated at USD 1285 million in 2023 and is projected to reach USD 1706.16 million by 2032, exhibiting a CAGR of 3.20% during the forecast period.

North America Amorphous Alloys Transformer market size was estimated at USD 353.45 million in 2023, at a CAGR of 2.74% during the forecast period of 2024 through 2032.
