Report Overview:

Amorphous steel is an alloy steel with advantageous magnetic properties necessary for use in distribution transformers, electric reactors, electric machines and middle and high frequency transformers. The iron- based amorphous steel is predominantly iron (Fe) (up to 82%), with boron (B) (8 percent to 15 percent), and silicon (Si) (5 percent to 10 percent) (SA1 and HB1M). AR may also contain carbon (C) alloyed to allow for its amorphous structure. Up to 25% of the iron (Fe) may be replaced with cobalt (Co) to allow for higher induction, to be used in pulse power applications (2605CO alloy). This AR is normally imported in the form of a singleply coil up to 1000kg in weight, or in a multiple-ply format where 3 to 10 sheets are co-wound onto a single hub.

The Global Amorphous Steels Market Size was estimated at USD 611.09 million in 2023 and is projected to reach USD 886.66 million by 2029, exhibiting a CAGR of 6.40% during the forecast period.
