## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amphiphilic Biopolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Amphiphilic biopolymers reached approximately 2400 kilotons, with an average global market price of around USD 610 per ton. Amphiphilic biopolymers are a class of naturally derived or bio-based macromolecules that possess both hydrophilic (water-attracting) and hydrophobic (water-repelling) segments within their molecular structure. This dual affinity enables them to self-assemble into various nanostructures?such as micelles, vesicles, and hydrogels?when dispersed in aqueous environments. They are commonly synthesized by chemically modifying biopolymers (e.g., polysaccharides, proteins, or polyesters) with hydrophobic groups or by copolymerizing hydrophilic and hydrophobic monomers. Owing to their biocompatibility, biodegradability, and tunable amphiphilic properties, they find extensive use in drug delivery systems, tissue engineering, emulsion stabilization, and biosensing applications.

The global Amphiphilic Biopolymers market size was estimated at USD 1439.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the forecast period.
