## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amphiphilic Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Amphiphilic copolymers are macromolecules composed of both hydrophilic (water-attracting) and hydrophobic (water-repelling) segments within the same polymer chain. This dual affinity allows them to self-assemble into various nanostructures such as micelles, vesicles, and bilayers in aqueous environments. The unique amphiphilic nature makes these copolymers especially useful in drug delivery, emulsification, nanotechnology, and biomedical applications. Common types include block copolymers, graft copolymers, and random copolymers that combine polar (e.g., polyethylene glycol) and non-polar (e.g., polystyrene or polycaprolactone) segments. The key market drivers for amphiphilic copolymers include the growing demand for advanced drug delivery systems, where their ability to encapsulate hydrophobic drugs and release them in a controlled manner enhances therapeutic efficacy. Increasing investment in nanomedicine and biotechnology further boosts their adoption in targeted cancer therapies and gene delivery. Additionally, amphiphilic copolymers are increasingly used in personal care products, food emulsifiers, and coatings due to their excellent emulsifying and film-forming properties. Environmental concerns and the push for biodegradable materials are also driving innovation in bio-based amphiphilic copolymers, expanding their use in sustainable packaging and agriculture.

The global Amphiphilic Copolymers market size was estimated at USD 2739.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
