## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amphiphilic Diblock Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Amphiphilic diblock copolymers reached approximately 120 kilotons, with an average global market price of around USD 8,500 per ton. Amphiphilic diblock copolymers are a class of macromolecules composed of two covalently bonded polymer blocks—one hydrophilic (water-attracting) and one hydrophobic (water-repelling). This dual affinity causes them to self-assemble in selective solvents (typically water) into a variety of nanostructures such as micelles, vesicles, or lamellae. The ability of amphiphilic diblock copolymers to form stable, tunable nanostructures makes them highly useful in drug delivery systems, nanoreactors, and biomaterials. Common examples include poly(ethylene oxide)-b-poly(propylene oxide) (PEO-b-PPO) and poly(ethylene glycol)-b-polylactide (PEG-b-PLA).

The global Amphiphilic Diblock Copolymers market size was estimated at USD 1046.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
