Abstracts

Amphoteric ion polymers are a class of synthetic polymers that contain both positively charged (cationic) and negatively charged (anionic) functional groups within their molecular structure. These polymers are unique in that they can act as both acidic and basic substances, depending on the pH of their surroundings. Amphoteric Ion Polymers are used to prepare nanomaterials such as nanoparticles, microcapsules and micelles, which are important in areas such as drug delivery, imaging and biosensing. Amphoteric Ion Polymers are used in the biomedical field to prepare biocompatible materials such as biosensors, artificial organs, tissue engineering and slow release systems.

Amphoteric Ion Polymers can be used to improve the wettability, contamination resistance and biocompatibility of material surfaces, which is critical for applications such as medical devices, nanocoatings and biosensors. Amphoteric Ion Polymers have the ability to self-assemble in a controlled manner, allowing structural modulation by varying conditions such as pH, ionic concentration, and temperature to tailor the properties and functionality of the material. Amphoteric Ion Polymers also have potential for environmental protection in applications such as wastewater treatment, oil-water separation, and the adsorption and removal of organic pollutants. Overall, amphiphilic polymers have a variety of potential applications ranging from drug delivery to biomedicine, materials science and environmental protection. As science and technology advance, these materials will continue to evolve and innovate to meet evolving needs and challenges.

The global Amphoteric Ion Polymers market size was estimated at USD 1216.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
