### Report Overview:

Anaerobic digestion is a sequence of processes by which microorganisms break down biodegradable material in the absence of oxygen. The process is used for industrial or domestic purposes to manage waste or to produce fuels. Much of the fermentation used industrially to produce food and drink products, as well as home fermentation, uses anaerobic digestion. Anaerobic digestion occurs naturally in some soils and in lake and oceanic basin sediments, where it is usually referred to as "anaerobic activity". This is the source of marsh gas methane as discovered by Alessandro Volta in 1776.

The Global Anaerobic Digesters Market Size was estimated at USD 156.4 million in 2021 and is projected to reach USD 218.1 million by 2028, exhibiting a CAGR of 5.70% during the forecast period.
