Abstracts

An Analog Laser Distance Sensor is a device that utilizes laser technology to measure the distance to an object and provides an analog output signal proportional to the measured distance. It emits a laser beam towards the target object and measures the time it takes for the laser light to travel to the object and back. Based on the known speed of light, the sensor calculates the distance. The analog output of the sensor is typically a continuous voltage or current signal that varies linearly with the distance, allowing for precise measurement and easy integration with other analog - based electronic systems. This type of sensor is widely used in various applications such as industrial automation, robotics, distance measurement in construction, and automotive systems for functions like parking assistance and collision avoidance.

The global Analog Laser Distance Sensor market size was estimated at USD 1260.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
