### Report Overview:

The angular velocity transducer is a device used to sense and maintain the direction. It is designed based on the theory that angular momentum is immortal. Applying the principle of Coriolis force, once the gyroscope starts to rotate, the gyroscope has a tendency to resist the change of direction due to the angular momentum of the wheel. The built-in special ceramic device greatly simplifies the device structure and circuit device, so that it has superior operating characteristics. Mainly used in car navigation, position control and attitude control of moving objects, and other occasions that require accurate angle measurement.

The Global Angular Velocity Transducers Market Size was estimated at USD 2937.18 million in 2023 and is projected to reach USD 4334.28 million by 2029, exhibiting a CAGR of 6.70% during the forecast period.
