## Abstracts

Hydroxy benzotriazole, abbreviated HOBt, is an organic compound that is a derivative of benzotriazole. HOBt, as a commercial product, is a white crystalline powder that contains some water (~11.7% wt as the HOBt monohydrate crystal). Anhydrous HOBt is explosive. It is mainly used to suppress the racemization of single-enantiomer chiral molecules and to improve the efficiency of peptide synthesis. Automated peptide synthesis involves the condensation of the amino group of protected amino acids with the activated ester. HOBt can be used to produce activated esters such as N-hydroxysuccinimide ester. These esters are insoluble and react with amines at ambient temperature to give amides. HOBt is also used for the synthesis of amides from carboxylic acids as well as from amino acids. These substrates may not be convertible to the acyl chlorides. For instance, amide derivatives of ionophoric antibiotics have been prepared in this way. Peptide synthesis reagents are key materials for synthesizing peptide drugs. Amide bond is the basic structure of peptide drugs, and peptide synthesis reagent is the key reagent material to form the amide bond through condensation reaction, in which condensation reagent is the most core and most used peptide synthesis reagent product in condensation reaction, followed by protection reagent and chiral racemic inhibition reagent. Chiral racemization-inhibiting reagents are used in the synthesis of peptide drugs and small molecule chemical drugs, which can effectively inhibit the chiral racemization of the product during the condensation process, maintain the chiral structure of the drug, and improve the optical purity and drug activity of the product. The main representative products are HOAt, HOBt, HOSU, HONB, PFPOH, OXYMA, HOOBT, HOPO and so on.

The global Anhydrous Hydroxybenzotriazole market size was estimated at USD 73.9 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
