Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Anhydrous Milkfat (AMF) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Anhydrous milkfat is a product made from milk and/or cream or cream (fermented or unfermented) as raw materials, with or without food additives and nutritional fortifiers, and processed to produce a fat content of not less than 99.8%. Anhydrous milkfat is mainly composed of triglycerides, as well as small amounts of phospholipids, cholesterol, vitamins, and minerals. Due to its lack of moisture, anhydrous milkfat can remain stable at room temperature for a long time and is not easily oxidized or rancid, making it widely used in fields such as food manufacturing, cooking, and baking. In 2024, global Anhydrous Milkfat (AMF) production reached approximately 962 K MT, with an average global market price of around US\$ 4,561 per MT. The annual production capacity of a single production line is 10,000 tons, with a gross profit margin of about 20%. Upstream raw materials: Cream or butter: This is the most straightforward ingredient. Raw milk: A few large-scale integrated dairy companies will directly separate the cream from fresh milk and process it directly into AMF, but this requires extremely high scale and stability of the milk source. Downstream application areas: dairy products, biscuits, cakes and bakeries, chocolate and candies, ice cream and desserts, sauces. Raw material cost: 50%-70%; manufacturing overhead: 20%-35%; labor cost: 5%-10%. With the improvement of consumption level and the increasing demand for high-quality dairy products, the demand for anhydrous milk fat in the global market is gradually growing. In the food processing industry: Anhydrous milk fat, as a high-quality milk fat, is widely used in the production of dairy products (such as butter, cream, milk powder), chocolate, candies, baked goods, etc., because it can provide rich milk aroma and delicate taste. With people's increasing attention to nutrition

and health, the demand for dairy products is growing, especially high-quality dairy products rich in natural fats. The production process of AMF is gradually transitioning towards automation and large-scale production, making it more widely used by food processing plants and dairy producers. Despite the continuous development of the plant-based alternative dairy market, the position of anhydrous milk fat in traditional foods remains irreplaceable due to its differences in taste, flavor, and other aspects compared to traditional dairy products.

The global Anhydrous Milkfat (AMF) market size was estimated at USD 4387.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
