Abstracts

Anhydrous potassium acetate is a white, crystalline, hygroscopic salt with the chemical formula CH_3COOK , which is devoid of water molecules in its structure. It is widely utilized as a deicing agent for airport runways and roads due to its low environmental impact compared to chloride-based alternatives, as it is less corrosive to infrastructure and less harmful to vegetation and aquatic ecosystems. Additionally, it serves as a catalyst in organic synthesis, a buffering agent in pharmaceuticals and laboratory applications, a fire extinguisher component, and a food additive (E261), where it functions as a preservative and acidity regulator. Its production typically involves the reaction of potassium carbonate or hydroxide with acetic acid, followed by purification and dehydration processes to achieve the anhydrous form. The compound is valued for its solubility in water and alcohol, stability, and relatively low toxicity, making it suitable for diverse industrial, commercial, and scientific uses.

The global Anhydrous Potassium Acetate market size was estimated at USD 145.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
