Abstracts

Animal-infectives are medications or products used to treat or prevent infections in animals. These anti-infective agents can target various types of pathogens, including bacteria, viruses, fungi, and parasites that cause infections in animals. They are available in different forms such as oral medications, injections, topical treatments, and disinfectants for environmental surfaces. These are medications used to treat viral infections in animals. They can inhibit the replication of viruses or reduce their impact on the animal's immune system. Some examples include oseltamivir (Tamiflu) for influenza treatment in certain species and famciclovir for the treatment of feline herpesvirus infections. The use of animal anti-infectives should be based on proper diagnosis and veterinary guidance. It's important to follow the dosage instructions and recommended treatment protocols. When using these medications, it's also crucial to consider factors such as the animal species, age, weight, and any potential drug interactions or adverse reactions.
