Abstracts

Animal breeding management involves planned and controlled mating of animals in order to achieve specific genetic and reproductive goals. It is a process used in animal agriculture, breeding programs, and conservation efforts to improve desirable traits, maintain genetic diversity, and ensure the overall health and productivity of animal populations. Breeders carefully choose animals with desirable traits and characteristics to serve as the parents of future generations. This selection is based on factors such as genetic potential, physical conformation, performance records, and health status. Regular veterinary care, including health checks, vaccinations, parasite control, and reproductive evaluations, is important to ensure the overall reproductive health of breeding animals. Any issues or abnormalities are addressed promptly to optimize fertility and reproductive success. Accurate record-keeping is essential in animal breeding management to track breeding dates, pedigrees, health and reproductive data, and genetic information. This allows breeders to make informed decisions and monitor the progress of their breeding program.

The global Animal Breeding Management market size was estimated at USD 5808.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
