Abstracts

Animal external parasiticides are medications or treatments used to control and eliminate external parasitic infestations in animals. External parasites, such as fleas, ticks, mites, lice, or flies, can cause discomfort, irritation, and transmit diseases to animals. Insecticides are used to kill and control insects, including fleas, ticks, flies, and mosquitoes. They are available in various formulations such as sprays, spot-on treatments, powders, shampoos, and collars. Some insecticides can provide long-lasting protection against multiple pests. Acaricides specifically target and control external parasites like mites and ticks. They may be applied topically or administered orally, depending on the product and the species of animal being treated. Repellents are substances that repel or deter parasites. These products discourage pests from approaching or biting animals. Common repellents include sprays, collars, and topical treatments that provide temporary protection against external parasites. Some external parasiticides focus on treating the animal's environment to control infestations. These treatments target the habitats where parasites live and reproduce, reducing their population and preventing reinfestation.

The global Animal External Parasiticide market size was estimated at USD 4530.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
