## Abstracts

Animal immunoglobulin G (IgG) is one of the five major immunoglobulin classes and is the most abundant immunoglobulin category in animal serum and other bodily fluids. It belongs to the glycoprotein category that exhibits antibody activity. IgG consists of two heavy chains ( $\gamma$ -chains) and two light chains linked together by interchain disulfide bonds, forming a monomeric molecule with a four-peptide chain structure. IgG demonstrates high specificity, capable of recognizing and binding to specific antigens, and plays a pivotal role in immune defense, immune surveillance, and immune homeostasis in animals. IgG is not only utilized in the diagnosis and treatment of diseases but also plays an important role in disease monitoring, epidemiological investigations, and biotechnology research.

The global Animal Immunoglobulin G market size was estimated at USD 2793.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
