Abstracts

Animal internal parasiticides are medications or treatments used to control and prevent internal parasites in animals. Internal parasites, such as worms or protozoa, can infest the gastrointestinal tract, respiratory system, or other internal organs of animals, causing illness, poor growth, and reduced productivity. These are medications specifically designed to kill and eliminate internal worms, such as roundworms, tapeworms, hookworms, and whipworms. Anthelmintics can be administered orally, through injection, or as a topical treatment, depending on the targeted parasites and the animal species being treated. Antiprotozoal medications are used to treat and control internal protozoan infections, such as those caused by Giardia or Cryptosporidium. These medications may target the specific protozoa responsible for the infection and can be administered orally or through injection. Some parasiticides may contain a combination of active ingredients to target multiple types of internal parasites simultaneously. These combination products can be more convenient for treatment and control, as they can address multiple parasitic infections with a single medication.

The global Animal Internal Parasiticide market size was estimated at USD 6589.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
