Abstracts

Animal model is a living, non-human animal used during the research and investigation of human disease, for the purpose of better understanding the disease without the added risk of harming an actual human being during the process. Animal models have been used to address a variety of scientific questions, from basic science to the development and assessment of novel vaccines, or therapies. The use of animals is not only based on the vast commonalities in the biology of most mammals, but also on the fact that human diseases often affect other animal species. It is particularly the case for most infectious diseases but also for very common conditions such as Type I diabetes, hypertension, allergies, cancer, epilepsy, myopathies and so on. Not only are these diseases shared but the mechanisms are often also so similar that 90% of the veterinary drugs used to treat animals are identical or very similar to those used to treat humans. In our report, all the animals used in scientific purposes are included. The Animal Models Used in Tests market is driven by the growing need for reliable and reproducible preclinical data in drug discovery, toxicology studies, and biomedical research. Animal models play a critical role in understanding disease mechanisms, evaluating therapeutic efficacy, and ensuring safety before human trials. The increasing prevalence of chronic and genetic diseases, coupled with the rise in R&D activities by pharmaceutical and biotechnology companies, is fueling the demand for advanced and genetically modified animal models. Additionally, government funding and academic support for translational research are further propelling market growth, especially in areas like oncology, neurology, and infectious diseases. Despite their importance, the use of animal models in testing faces several challenges, including ethical concerns, high costs, and limitations in accurately mimicking human biology. Regulatory pressures and growing advocacy for animal welfare have led to stricter guidelines and increased demand for alternatives such as organ-on-a-chip and computer-based simulations. Furthermore, the development and maintenance of genetically modified or disease-

specific models require significant investment and specialized facilities. The reproducibility crisis in biomedical research, partly due to variability in animal studies, also threatens scientific credibility. Overcoming these issues requires ethical oversight, technological innovation, and balanced integration of alternative methods.

The global Animal Models Used in Tests market size was estimated at USD 2617.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
