## Abstracts

An animal-repellent net is used to prevent wild boars, and other vermin from entering farmland and fields. While there are many different ways to prevent vermin, animal-repellent nets are easy to consider as a basic measure. Because they are a relatively easy and reliable method of interception, they are often implemented as the first step in vermin control measures. One of the advantages of animal-repellent nets is that they can prevent crop damage. When vermin invade, they destroy farmland and crops in the field. Animal-repellent nets can prevent them from entering farmland and dealing damage. In addition, the area of the net can be adjusted according to the size of the farmland, making it easy for each party to take measures against damage. The disadvantage of animal-repellent nets is that they are expensive. The larger the area of farmland to be enclosed by animal-repellent nets, and the greater the cost.

The global Animal Repellent Net market size was estimated at USD 1120.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
