Abstracts

A veterinary or animal tomography system is a diagnostic imaging device that uses X-ray computed tomography (CT) to produce detailed cross-sectional images of an animal's internal anatomy. These systems are specifically designed to accommodate the diverse range of sizes and anatomical variations across animal species, from small companion animals like cats and dogs to large animals such as horses and livestock. The technology allows for non-invasive visualization of bones, soft tissues, and vascular structures with high spatial resolution, aiding in the diagnosis of diseases, injuries, tumors, and neurological conditions. Advanced systems may include features such as multi-slice detectors, 3D reconstruction, and low-dose protocols to ensure patient safety while maintaining diagnostic accuracy.

The global Animal Tomography System market size was estimated at USD 510.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
