Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Anionic Flocculant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Anionic flocculants are a class of high-molecular-weight compounds bearing negative charges, typically generated by the dissociation of carboxylate, sulfonate, or other anionic groups on their molecular chains in aqueous solutions. Their primary purpose is to facilitate the aggregation and sedimentation of suspended particles, colloids, or dissolved pollutants through charge neutralization, adsorption bridging, and sweep flocculation mechanisms. The significance of anionic flocculants lies in their ability to leverage negative charges to attract positively charged or neutral particles, forming larger flocs that enhance solid-liquid separation and turbidity reduction, thereby improving treatment efficiency. Their benefits include low toxicity, excellent environmental compatibility, and high flocculation efficiency, making them particularly effective for systems with positively charged or neutral particles. Functionally, anionic flocculants increase floc size, accelerate sedimentation rates, and improve water clarity. By optimizing molecular weight and charge density, they can adapt to diverse particle systems, significantly reducing treatment costs and enhancing operational efficiency. Additionally, they can mitigate the toxic effects of certain cationic flocculants through synergistic interactions, demonstrating superior stability and adaptability in flocculation processes. The future development trends of anionic flocculants are primarily reflected in the pursuit of high efficiency, environmental friendliness, compounding, and the expansion of application areas. High-molecular-weight anionic flocculants, with their excellent adsorption and bridging abilities, can significantly improve the speed and effectiveness of flocculation and sedimentation, satisfying the needs for efficient water treatment. Concurrently, as environmental

protection requirements become stricter, non-toxic, low-toxicity, and biodegradable bio-based anionic flocculants (such as sodium carboxymethyl cellulose) are expected to see greater growth. There will also be more stringent demands for reducing the presence of toxic monomer residues in the production process. Moreover, in response to complex water quality issues, the combined use of anionic flocculants with other types of flocculants or auxiliary agents will become a trend. This approach, through synergistic effects, enhances treatment efficacy and reduces costs, thereby promoting their application in a wider range of fields.

The global Anionic Flocculant market size was estimated at USD 1516.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
