Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Anisotropic Ferrite Magnet competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An anisotropic ferrite magnet is a hard ferrite (strontium or barium ferrite) magnetic material that is pressed and sintered under an applied magnetic field so its crystal grains align in one preferred orientation, giving it significantly higher magnetic strength (Br, Hc, BHmax) than isotropic ferrite. Its supply chain begins with raw materials such as Fe₂O₃, BaCO₃/SrCO₃, additives, and fluxes; followed by calcination to form ferrite powder, wet milling to controlled particle size, and magnetic-field pressing (uniaxial or die press) to induce anisotropy. The pressed bodies then go through sintering, machining (if needed), surface coating (epoxy, nickel, phosphate), and magnetizing with a high-energy pulse. Downstream, these magnets move to component integrators and OEMs for motors, speakers, sensors, automotive components, appliance motors, and industrial machinery producers, creating a vertically connected chain from chemical suppliers → ferrite powder producers → sintered magnet manufacturers → motor/speaker OEMs → end-use industries. In 2024, global anisotropic ferrite magnet output reached 2.25 million tons with capacity at 2.65 million tons, priced at USD 1,450-2,850 per ton and delivering an average 23% gross margin.

The global Anisotropic Ferrite Magnet market size was estimated at USD 3847.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
