Abstracts

The annular BOP packing element is a critical component of blowout preventer (BOP) systems used in oil and gas drilling operations, specifically designed to form a pressure-tight seal around drill pipes, casing, or other cylindrical objects in the wellbore to prevent uncontrolled releases of hydrocarbons. These elastomeric elements, typically constructed from high-performance materials such as nitrile rubber or hydrogenated nitrile butadiene rubber (HNBR), are engineered to withstand extreme pressure, temperature, and chemical exposure while maintaining flexibility and resilience. Installed within the annular BOP, the packing element functions by contracting radially when hydraulic pressure is applied, creating a secure seal that can adapt to various sizes and shapes of tubular goods, thereby ensuring well control and operational safety during drilling, completion, and intervention activities.

The global Annular Bop Packing Element market size was estimated at USD 32.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
